## Introduction

Reactome is open-source, open access, manually curated and peer-reviewed pathway database. Pathway annotations are authored by expert biologists, in collaboration with Reactome editorial staff and cross-referenced to many bioinformatics databases. A system of evidence tracking ensures that all assertions are backed up by the primary literature. Reactome is used by clinicians, geneticists, genomics researchers, and molecular biologists to interpret the results of high-throughput experimental studies, by bioinformaticians seeking to develop novel algorithms for mining knowledge from genomic studies, and by systems biologists building predictive models of normal and disease variant pathways.

The development of Reactome is supported by grants from the US National Institutes of Health (P41 HG003751), University of Toronto (CFREF Medicine by Design), European Union (EU STRP, EMI-CD), and the European Molecular Biology Laboratory (EBI Industry program).

Reactome database release: 88

This document contains 1 pathway and 2 reactions ([see Table of Contents](#))

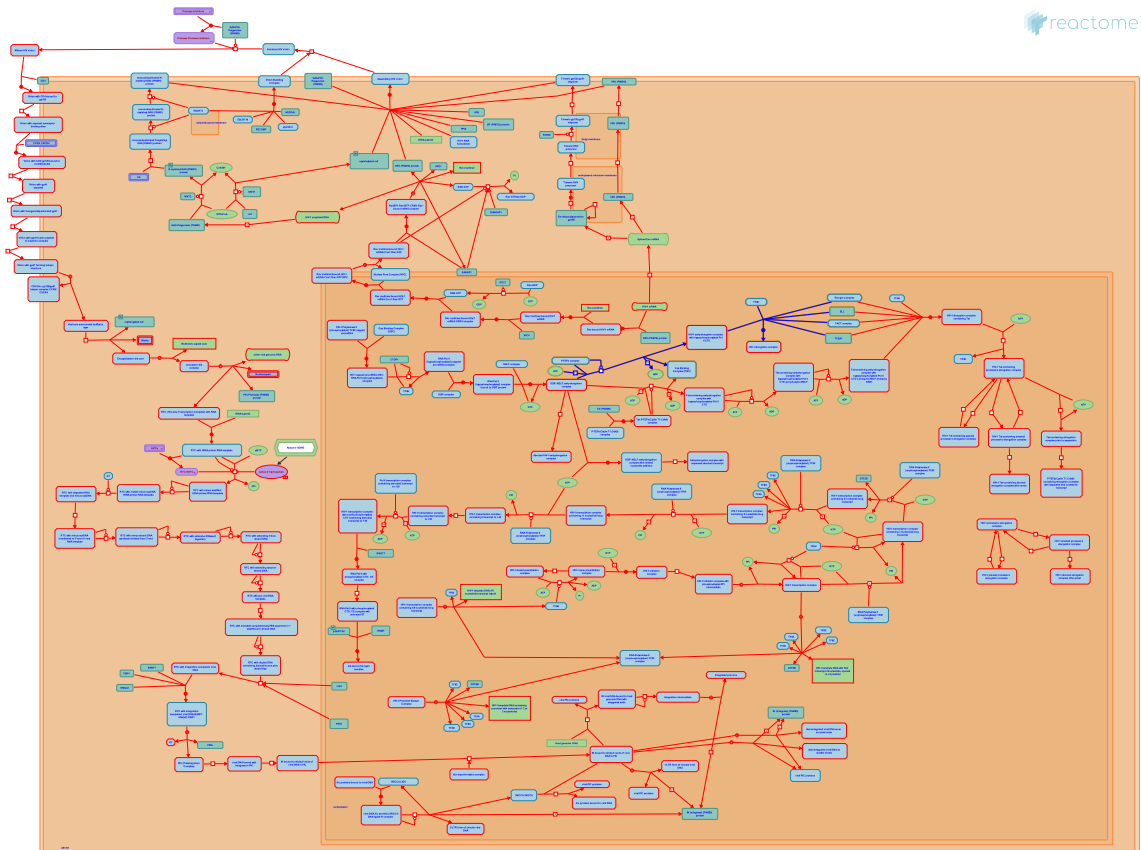

## Formation of HIV elongation complex in the absence of HIV Tat ↗

**Stable identifier:** R-HSA-167152

**Compartments:** nucleoplasm

**Diseases:** Human immunodeficiency virus infectious disease

**Inferred from:** Formation of RNA Pol II elongation complex (Homo sapiens)

During the formation of the HIV elongation complex in the absence of HIV Tat, elongation factors are recruited to form the HIV-1 elongation complex (Hill and Sundquist 2013) and P-TEFb complex hyperphosphorylates RNA Pol II CTD (Hermann and Rice, 2005, Zhou et al., 2000).

## Hyperphosphorylation (Ser2) of RNA Pol II CTD by P-TEFb complex ↗

**Location:** Formation of HIV elongation complex in the absence of HIV Tat

**Stable identifier:** R-HSA-167084

**Type:** transition

**Compartments:** nucleoplasm

**Diseases:** Human immunodeficiency virus infectious disease

**Inferred from:** Hyperphosphorylation (Ser2) of RNA Pol II CTD by P-TEFb complex (Homo sapiens)

The association between Tat, TAR and P-TEFb is believed to bring the catalytic subunit of P-TEFb(Cyclin T1:Cdk9) in close proximity to Pol II where it hyperphosphorylates the CTD of Pol II (Herrmann et al., 1995; Zhou et al. 2000). In the presence of Tat, P-TEFb(Cyclin T1:CDK9) has been shown to phosphorylate serine 5 in addition to serine 2 suggesting that modification of the substrate specificity of CDK9 may play a role in the ability of Tat to promote transcriptional elongation (Zhou et al. 2000).

**Followed by:** Recruitment of elongation factors to form HIV-1 elongation complex

## Recruitment of elongation factors to form HIV-1 elongation complex ↗

**Location:** Formation of HIV elongation complex in the absence of HIV Tat

**Stable identifier:** R-HSA-167077

**Type:** binding

**Compartments:** nucleoplasm

**Diseases:** Human immunodeficiency virus infectious disease

**Inferred from:** Recruitment of elongation factors to form elongation complex (Homo sapiens)

Elongation factors are recruited to form the HIV-1 elongation complex (Hill and Sundquist 2013).

**Preceded by:** Hyperphosphorylation (Ser2) of RNA Pol II CTD by P-TEFb complex
