Introduction

Reactome is open-source, open access, manually curated and peer-reviewed pathway database. Pathway annotations are authored by expert biologists, in collaboration with Reactome editorial staff and cross-referenced to many bioinformatics databases. A system of evidence tracking ensures that all assertions are backed up by the primary literature. Reactome is used by clinicians, geneticists, genomics researchers, and molecular biologists to interpret the results of high-throughput experimental studies, by bioinformaticians seeking to develop novel algorithms for mining knowledge from genomic studies, and by systems biologists building predictive models of normal and disease variant pathways.

The development of Reactome is supported by grants from the US National Institutes of Health (P41 HG003751), University of Toronto (CFREF Medicine by Design), European Union (EU STRP, EMI-CD), and the European Molecular Biology Laboratory (EBI Industry program).

Reactome database release: 88

This document contains 1 reaction ([see Table of Contents](#))

Phosphorylation of pPTK2 by SRC [↗](#)

Stable identifier: R-HSA-354124

Type: transition

Compartments: cytosol, plasma membrane

The recruitment of FAK to active SRC leads to the efficient tyrosine phosphorylation of multiple additional sites on FAK. SRC trans-phosphorylates FAK within the kinase domain activation loop (Y576 and Y577) and within the FAK C-terminal domain (Y861 and Y925).
