Introduction

Reactome is open-source, open access, manually curated and peer-reviewed pathway database. Pathway annotations are authored by expert biologists, in collaboration with Reactome editorial staff and cross-referenced to many bioinformatics databases. A system of evidence tracking ensures that all assertions are backed up by the primary literature. Reactome is used by clinicians, geneticists, genomics researchers, and molecular biologists to interpret the results of high-throughput experimental studies, by bioinformaticians seeking to develop novel algorithms for mining knowledge from genomic studies, and by systems biologists building predictive models of normal and disease variant pathways.

The development of Reactome is supported by grants from the US National Institutes of Health (P41 HG003751), University of Toronto (CFREF Medicine by Design), European Union (EU STRP, EMI-CD), and the European Molecular Biology Laboratory (EBI Industry program).

Reactome database release: 88

This document contains 1 reaction ([see Table of Contents](#))

botE:SV2:GT1b internalized from target cell plasma membrane to synaptic vesicle membrane [↗](#)

Stable identifier: R-HSA-5244500

Type: omitted

Compartments: plasma membrane, synaptic vesicle membrane

Diseases: botulism

Synaptic vesicles re-form rapidly after exocytosis, carrying vesicle membrane proteins that had been exposed on the cell surface by exocytosis back into the cell (Sudhoff 2004). The botulinum toxin type E disulfide bonded heavy chain - light chain heterodimer (botE HC:LC) bound to ganglioside GT1b and synaptic vesicle protein 2A (SV2A) or 2B (SV2B) is inferred to be taken up as well, delivering it to the re-formed synaptic vesicle.
