Introduction

Reactome is open-source, open access, manually curated and peer-reviewed pathway database. Pathway annotations are authored by expert biologists, in collaboration with Reactome editorial staff and cross-referenced to many bioinformatics databases. A system of evidence tracking ensures that all assertions are backed up by the primary literature. Reactome is used by clinicians, geneticists, genomics researchers, and molecular biologists to interpret the results of high-throughput experimental studies, by bioinformaticians seeking to develop novel algorithms for mining knowledge from genomic studies, and by systems biologists building predictive models of normal and disease variant pathways.

The development of Reactome is supported by grants from the US National Institutes of Health (P41 HG003751), University of Toronto (CFREF Medicine by Design), European Union (EU STRP, EMI-CD), and the European Molecular Biology Laboratory (EBI Industry program).

Reactome database release: 88

This document contains 1 pathway and 1 reaction ([see Table of Contents](#))

Mycothioliol catabolism ↗

Stable identifier: R-MTU-879325

Mycothioliol and its adducts that result from detoxification can be readily cleaved into smaller molecules. The mycothioliol pool therefore serves as storage for unstable cysteine and sugars. (Rawat and Av-Gay, 2007; Newton et al, 2008)

mycothiol is cleaved to acetylcysteine and glucosaminylinositol [↗](#)

Location: [Mycothiol catabolism](#)

Stable identifier: R-MTU-879281

Type: transition

Compartments: cytosol

The degradation of mycothiol proceeds through its cleavage into acetylcysteine and glucosaminylinositol which both are completely degradable further. (Steffek et al, 2003)
